

We claim:

- 1) An automated storage and retrieval device for trays holding subject matter, comprising:
 - A) a storage rack for storing a plurality of trays,
 - B) at least one automated machine,
 - C) a storage gantry for moving said plurality of trays between said storage rack and said at least one automated machine, and
 - D) at least one computer system programmed to control said storage gantry.
- 2) The automated storage and retrieval device as in Claim 1 further comprising an access device, wherein said storage gantry moves said plurality of trays between said storage rack and said access device.
- 3) The automated storage and retrieval device as in Claim 1, wherein said at least one automated machine is an inspection device.
- 4) The automated storage and retrieval device as in Claim 3, wherein said inspection device is a device for inspecting and classifying a plurality of microscopic crystals.
- 5) The automated storage and retrieval device as in Claim 4, wherein said at least one inspection device comprises:
 - A) at least one camera,
 - B) an indexing device for sequentially placing said microscopic crystals in camera-view of said at least one camera, and
 - C) at least one control computer programmed to control said indexing device and said at least one camera, wherein said at least one control computer is programmed to receive from said at least one camera images of said plurality of microscopic crystals.

- 6) The automated storage and retrieval device as in Claim 5, wherein said at least one control computer automatically classifies said plurality of microscopic crystals after receiving said images.
- 7) The automated storage and retrieval device as in Claim 1, wherein said automated machine comprises:
 - A) at least one camera,
 - B) an indexing device for receiving said plurality of trays and for placing said subject matter in camera view of said at least one camera,
 - C) at least one control computer programmed to control said indexing device and said at least one camera, wherein said at least one control computer is programmed to receive from said at least one camera images of said subject matter.
- 8) The automated storage and retrieval device as in Claim 7, wherein said automated machine further comprises an LED light source for illuminating said subject matter.
- 9) The automated storage and retrieval device as in Claim 1, wherein said at least one automated machine is an automated micro-well plate filling machine.
- 10) The automated storage and retrieval device as in Claim 1, wherein said at least one automated machine comprises:
 - A) a micro-well plate filling assembly, comprising:
 1. an indexing device, and
 2. a fill mechanism in communication with a media source and positioned to insert portions of said media into the empty micro-well plates, and
 - B) an automatic control unit programmed to cause said indexing device to move empty micro-well plates adjacent to said fill mechanism, and to cause said fill mechanism to inject media from said media source into wells in the micro-well plates.

- 11) The automated storage and retrieval device as in Claim 1, wherein said subject matter is solution inside at least one micro-well plate.
- 12) The automated storage and retrieval device as in Claim 11, wherein said at least one micro-well plate comprises a bar code, wherein said automated storage and retrieval device further comprises at least one bar code reader in communication with said at least one computer system.
- 13) The automated storage and retrieval device as in Claim 1, wherein said plurality of trays holds at least one micro-well plate, wherein said storage gantry comprises at least one robotic gripper, wherein said plurality of trays comprises:
- A) at least one cut-down access area for said at least one robotic gripper,
 - B) a corner flat for tray orientation, and
 - C) a plurality of tapered guide pillars for guiding said at least one micro-well plate into said plurality of trays.
- 14) A method for automatically storing and retrieving a plurality of trays, wherein said plurality of trays holds subject matter, comprising the steps of:
- A) receiving a plurality of trays into a storage rack,
 - B) transferring via a storage gantry said plurality of trays from said storage rack to an automated machine,
 - C) transferring via said storage gantry said plurality of trays from said automated machine to said storage rack, and
 - D) controlling the movement of said storage gantry via at least one programmed computer system.
- 15) The method as in Claim 14, further comprising the step of inserting said plurality of trays into an access device, wherein said storage gantry transfers said plurality of trays from said access device to said storage rack and from said storage rack to said access device.

- 16) The method as in Claim 14, wherein said subject matter is a plurality of microscopic crystals and at least one automated machine is a device for inspecting and classifying said plurality of microscopic crystals.
- 17) The method as in Claim 16, wherein said at least one automated machine comprises:
- A) at least one camera,
 - B) an indexing device for sequentially placing said microscopic crystals in camera-view of said at least one camera, and
 - C) at least one control computer programmed to control said indexing device and said at least one camera, wherein said at least one control computer is programmed to receive from said at least one camera images of said plurality of microscopic crystals, wherein said at least one control computer is programmed to classify said plurality of microscopic crystals.
- 18) The method as in Claim 17, wherein said at least one control computer automatically classifies said plurality of microscopic crystals after receiving said images.
- 19) The method as in Claim 14, wherein said at least one automated machine is an automated micro-well plate filling machine.
- 20) The method as in Claim 14, wherein said at least one automated machine comprises:
- A) a micro-well plate filling assembly, comprising:
 - 1. an indexing device, and
 - 2. a fill mechanism in communication with a media source and positioned to insert portions of said media into the empty micro-well plates, and
 - B) an automatic control unit programmed to cause said indexing device to move empty micro-well plates adjacent to said fill mechanism, and to cause said fill mechanism to inject media from said media source into wells in the micro-well plates.

21) The method as in Claim 14, wherein said plurality of trays holds at least one micro-well plate.

22) The method as in Claim 21, wherein said at least one micro-well plate comprises a bar code, wherein said automated storage and retrieval device further comprises at least one bar code reader in communication with said at least one computer system.

23) The method as in Claim 14, wherein said plurality of trays holds at least one micro-well plate, wherein said storage gantry comprises at least one robotic gripper, wherein said plurality of trays comprises:

- A) at least one cut-down access area for said at least one robotic gripper,
- B) a corner flat for tray orientation, and
- C) a plurality of tapered guide pillars for guiding said at least one micro-well plate into said plurality of trays.

24) The method as in Claim 14, wherein said automated machine comprises:

- A) at least one camera,
- B) an indexing device for receiving said plurality of trays and for placing said subject matter in camera view of said at least one camera,
- C) at least one control computer programmed to control said indexing device and said at least one camera, wherein said at least one control computer is programmed to receive from said at least one camera images of said subject matter.

*Rule 126
23*
24) An automated storage and retrieval device for trays holding subject matter, comprising:

- A) a storage rack means for storing a plurality of trays,
- B) at least one automated machine means,
- C) a storage gantry means for moving said plurality of trays between said storage rack means and said at least one automated machine means, and

D) at least one computer system means programmed to control said storage gantry means.

24/ 25) The automated storage and retrieval device as in Claim 24 further comprising an access means, wherein said storage gantry means moves said plurality of trays between said storage rack means and said access means.

27/ 26) The automated storage and retrieval device as in Claim 24, wherein said at least one automated machine means is an inspection means.

28/ 27) The automated storage and retrieval device as in Claim 26, wherein said inspection means is a device for inspecting and classifying a plurality of microscopic crystals.

29/ 28) The automated storage and retrieval device as in Claim 27, wherein said at least one inspection means comprises:

A) at least one camera,

B) an indexing means for sequentially placing said microscopic crystals in camera-view of said at least one camera, and

C) at least one control computer programmed to control said indexing means and said at least one camera, wherein said at least one control computer is programmed to receive from said at least one camera images of said plurality of microscopic crystals.

30/ 29) The automated storage and retrieval device as in Claim 28, wherein said at least one control computer automatically classifies said plurality of microscopic crystals after receiving said images.

31/ 30) The automated storage and retrieval device as in Claim 24, wherein said automated machine means comprises:

A) at least one camera,

B) an indexing means for receiving said plurality of trays and for placing said subject matter in camera view of said at least one camera,

C) at least one control computer programmed to control said indexing means and said at least one camera, wherein said at least one control computer is programmed to receive from said at least one camera images of said subject matter.

32

31) The automated storage and retrieval device as in Claim 30, wherein said automated machine means further comprises an LED light source for illuminating said subject matter.

33

32) The automated storage and retrieval device as in Claim 24, wherein said at least one automated machine means is an automated micro-well plate filling machine.

34

33) The automated storage and retrieval device as in Claim 24, wherein said at least one automated machine means comprises:

A) a micro-well plate filling assembly, comprising:

1. an indexing device, and
2. a fill mechanism in communication with a media source and positioned to insert portions of said media into the empty micro-well plates, and

B) an automatic control unit programmed to cause said indexing device to move empty micro-well plates adjacent to said fill mechanism, and to cause said fill mechanism to inject media from said media source into wells in the micro-well plates.

35

34) The automated storage and retrieval device as in Claim 24, wherein said subject matter is solution inside at least one micro-well plate.

36

35) The automated storage and retrieval device as in Claim 34, wherein said at least one micro-well plate comprises a bar code, wherein said automated storage and retrieval

device further comprises at least one bar code reader in communication with said at least one computer system.

37) The automated storage and retrieval device as in Claim 24, wherein said plurality of trays holds at least one micro-well plate, wherein said storage gantry comprises at least one robotic gripper, wherein said plurality of trays comprises:

- A) at least one cut-down access area for said at least one robotic gripper,
- B) a corner flat for tray orientation, and
- C) a plurality of tapered guide pillars for guiding said at least one micro-well plate into said plurality of trays.

38) A method for growing protein crystals, comprising the steps of:

- A) inserting drops of protein solution into a plurality of micro-well plates,
- B) placing said plurality of micro-well plates onto a plurality of trays,
- C) receiving said plurality of trays into a storage rack,
- D) transferring via a storage gantry said plurality of trays from said storage rack to an automated machine,
- E) analyzing via said automated machine said drops of protein solution,
- F) transferring via said storage gantry said plurality of trays from said automated machine to said storage rack, and
- G) controlling the movement of said storage gantry via at least one programmed computer system.

39) Protein crystals grown by a method comprising the steps of :

- A) inserting drops of protein solution into a plurality of micro-well plates,
- B) placing said plurality of micro-well plates onto a plurality of trays,
- C) receiving said plurality of trays into a storage rack,
- D) transferring via a storage gantry said plurality of trays from said storage rack to an automated machine,
- E) analyzing via said automated machine said drops of protein solution,

- F) transferring via said storage gantry said plurality of trays from said automated machine to said storage rack, and
- G) controlling the movement of said storage gantry via at least one programmed computer system.

40/
39) An automated storage and retrieval device for at least one micro-well plate holding subject matter, comprising:

- A) a storage rack for storing said at least one micro-well plate,
- B) at least one automated machine,
- C) a storage gantry for moving said at least one micro-well plate between said storage rack and said at least one automated machine, and
- D) at least one computer system programmed to control said storage gantry.

41/
40) The automated storage and retrieval device as in Claim 39, wherein said at least one automated machine is an inspection device comprising:

- A) at least one camera,
- B) an indexing device for sequentially placing said at least one micro-well plate in camera-view of said at least one camera, and
- C) at least one control computer programmed to control said indexing device and said at least one camera, wherein said at least one control computer is programmed to receive from said at least one camera images of said subject matter in said at least one micro-well plate.
